Phase I Proposal

Team Name: Blueberry Gorilla
Members: Rugved Rajendra, Varun Chandrashekhar, Keshav Garg

Template: Suspense Generation

Type of Crime Story

- Crime: Murder
- Mystery solving aspect will be led by a detective
- Double Story
  - Main Story: Crime Solving
  - Hidden Story: Events prior to crime and details of the crime - told by detective
- Detective will be on a clock to solve the mystery

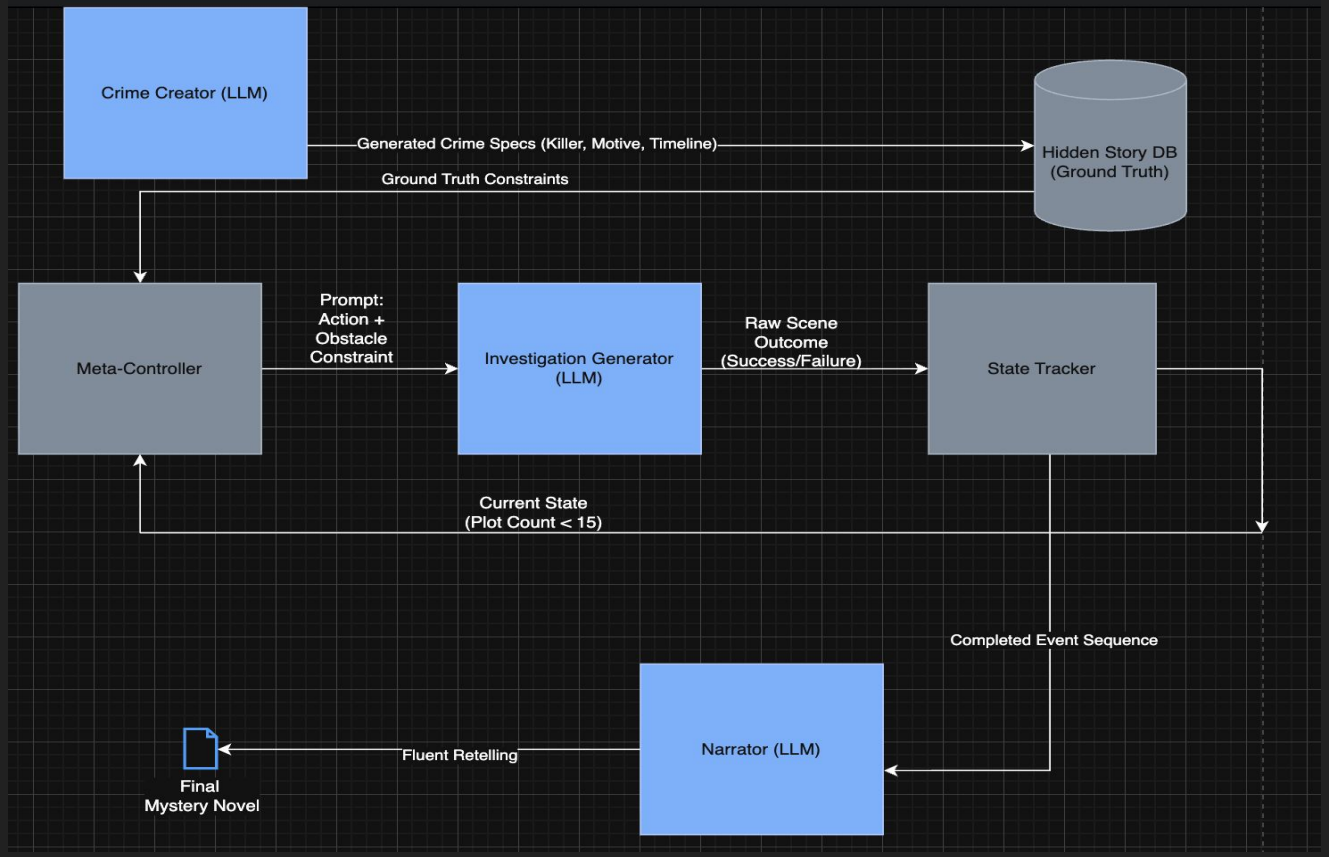
Crime story vs Solving story

- Crime Story
  - Identity of the criminal
  - Criminal’s true motive
  - Timeline of everything the criminal did to be successful
- Solving Story
  - Discovering clues
  - Questioning suspects and conducting cross-examinations
  - Validating suspects stories
  - Piecing together all the pieces

Complexity

- Multiple plausible suspects
  - Each has their own means, motive, and opportunity
- Some characters will lie in their testimonies for personal reasons
- Detective will find “clues” that are irrelevant to investigation
- Criminal is actively working to confuse detective

Architecture Diagram



Potential Pitfalls

- Suspense should happen in the uncovering of the crime NOT in backstory of how the crime is committed
  - Crime story will be fully generated prior to solving story
  - Solving story will include foundational introduction for the detective and time pressure $\Rightarrow$ suspense
  - Detective will face obstacles and confounding information during investigation
- Contradictions between Crime and Solving stories
  - Each prompt to the Solving story will feed in key details from the Crime story to limit generation scope

Template-specific questions addressed

- If you pre-generate the crime details, how do you adapt the technique to use the details?
  - Consolidate all the important details from the pre-generated story into a dictionary
  - Keep a running dictionary to represent the state of the solving story and update it as the detective investigates
- If you generate the crime details as you generate the suspenseful crime solving, how do you ensure that the crime details are consistent with each other
  - Keep a state dictionary shared between the crime and solving stories
  - After a few iterations, certain keys cannot be updated
  - Each iteration ends by double checking consistency between story and dictionary
